## ANNOTAZIONI.

La piena e la magra ordinaria sono detratte per ciascuna serie idrometrica basandosi sul criterio di frequenza, ammettendo come ordinarietà dell'evento la frequenza del 75 per cento

Le osservazioni idrometriche e quelle di torbide e temperature delle acque sono effettuate alle ore 12 o ricavate per quell'ora dai diagrammi degli idrometrografi.

Il segno ** indica la massima altezza idrometrica.

id. * id. la minima id. id.

Le temperature dell'aria sono calcolate con la formula di Kämtz: $t^{min} + K\ (t^{max} - t^{min})$.

Il segno (*) indica che mancano le osservazioni.

Corrisponde al segno » adottato dal Servizio Idrografico Centrale e verrà adottato dall'Ufficio Idrografico del Po a partire dagli annali 1927.

La dizione « coefficente di torbida » corrisponde alla dizione « torbidità specifica » adottata dal Servizio Idrografico Centrale e verrà adottata dall'Ufficio Idrografico del Po a partire dagli annali 1927.

## ERRATA CORRIGE

Nella stazione di S. Salvatore sulla Trebbia le quantità di Torbida rappresentano totali giornalieri in metri cubi e non coefficenti in $cm.^3$ per m. c.
